

## GUIDELINES FOR PREPARING IMAGES FOR PROJECTION

Bring three images to the share and discuss session that can be transferred to a laptop for projection.

- Make long side 1024 pixels
- .jpeg
- sRGB
- set ppi/dpi at 96
- Note: If you create these in Lightroom, simply fill in the blanks in the order they appear.

IF DOING IN PHOTOSHOP, set pixels/inch FIRST, then set pixel dimension long side to 1024 pixels, otherwise your image may be really small if you reverse that order.

Use either thumb drive memory stick or CDR. Please have all your images for this project in one folder and labeled, and, if you want them to appear in order when projected, be sure to number the images.
